INTRODUCTION

The Geominero Museum (Figure. 1) is located on the first floor of the Spanish Geological and Mining Institute (IGME), which was built as the headquarters of the organisation between 1921 and 1941. The building was declared a Property of Cultural Interest in 1998 due to its architectural value.

The museum contains several geological collections: of fossils, minerals, rocks and other geological items. Some rock collections are of great historical value as they contain specimens gathered by famous geologists and mining engineers during the 19th and early 20th centuries, when the IGME was known by the name of “the Spanish Geological Map Commission” (Lozano & Rábano, 2001, 2004; González Laguna et al., 2007). The mineral and fossil collections also include historical items documenting the original works of the Commission (Lozano et al., 2005).

As a national geological service, the IGME has participated in numerous projects, resulting in the collection of geological specimens from all around the Spanish territory. The collection of Spanish minerals entitled the “Mineral Collection of the Autonomous Regions and Cities” is a testament to these origins, although many of the specimens in it are derived from other activities such as collection campaigns organised by the museum itself, donations from private individuals, exchanges and acquisitions.

The aim of the present work is to present the “Catalogue of Minerals of the Madrid Region”, as one of the main milestones in the project entitled “Refurbishment and enhancement of the mineral collection of the Autonomous Regions in the Geominero Museum: Madrid and Castilla-La Mancha”, which was sponsored by the IGME for three years and finalised at the end of 2011. This project marked the start of the refurbishment of the museum’s collection of Spanish minerals.

Figure 1. Main room in the Geominero Museum.

THE COLLECTION OF SPANISH MINERALS

The mineral collection of the Autonomous Regions and Cities is displayed in 27 cabinets on the second tier of balconies in the museum (Fig. 2). Most of the Spanish mineral collection is conserved in the lower drawers of each cabinet.

The main aim of this exhibition is to display a selection of minerals that are representative of the most important Spanish sites. The collection therefore has a wealth of specimens from exhausted mining operations or extinct sites and also includes a large number of mineral findings from recent decades.

In 1927 the core of the collection was moved definitively to the large room it currently occupies in the museum, which had been inaugurated one year earlier by King Alfonso XIII. There is scarcely any record of the events undergone by this collection between the inauguration and the 1970s. One of the few known facts is that the Spanish rocks and minerals were transferred from the first to the second tier of balconies in the museum, where they remain today. In the 1980s, after the Statute of the Autonomous Regions came into force, the specimens were displayed by the regional agencies, and the process of digitising the collections and producing new labels was begun. The shelves were subsequently remodelled to improve the view of the specimens, a white background was added to give greater luminosity to the cabinets, the old labels were replaced, and panels were added with graphic and written information on the specimens and the sites.

Despite all this work, the collection still had many deficiencies, namely the absence of some characteristic mineral species, and errors and omissions in the information and classification. Thus in September 2008 the cabinets for the Castilla-La Mancha and Madrid regions were chosen as the first candidates for a review of this collection. Specimens from these regions cover a space proportional to their geographic area: those from Castilla-La Mancha are displayed in cases 120, 121 and 122, whereas those from the Madrid Region are shown in case 112.

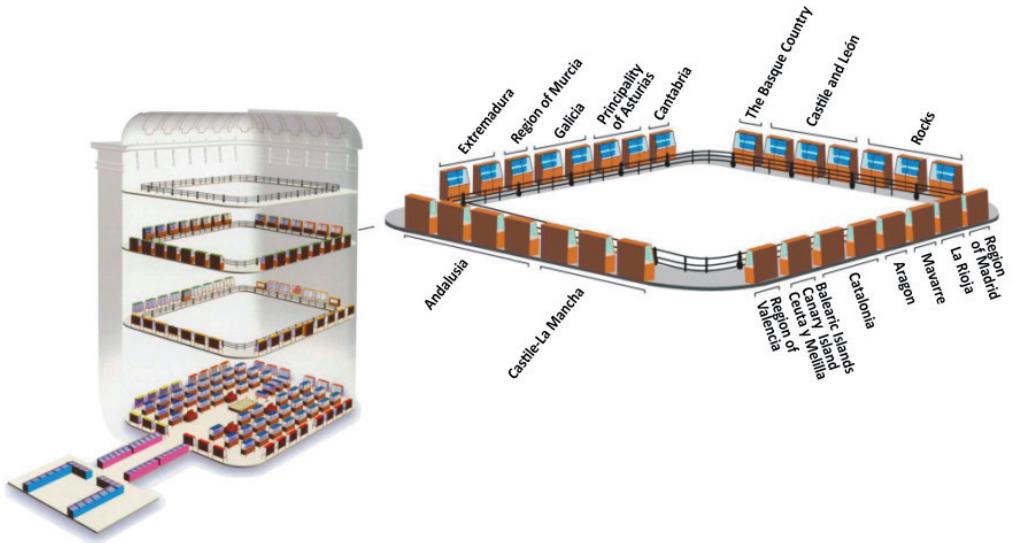

Figure 2. Location of the Mineral Collection of the Autonomous Regions and Cities.

PREVIOUS STATE OF THE COLLECTIONS: CASTILLA-LA MANCHA AND MADRID

To determine the state of the collection prior to the implementation of the project, a review was conducted of the specimens from the regions of Castilla-La Mancha and Madrid, including both the items on display and those held in storage, in addition to the available documentation. The current state of conservation of the minerals was also documented.

To verify whether the specimens in the collections were representative of the sites in these regions and to identify any deficiencies, the main guides to Spanish mineral sites were reviewed (Calderón, 1910; Del Valle González & González Cesteros, 1990), along with other works containing information about specimens of interest in collections and museums. For the province of Albacete, in Castilla-La Mancha, approximately one third of the minerals of interest described in the bibliography were found to be inventoried, and around 20% of the sites, although it was particularly significant that specimens were only conserved from three sites.

The representation of minerals of interest from the province of Ciudad Real in the museum was somewhat less than 40%, and almost half the sites of interest indicated in the bibliography. Only a quarter of the minerals of interest in the province of Cuenca were represented, and around 10% of the sites. The most significant finding was that the museum had minerals from only four sites, and yet Cuenca, along with Guadalajara, is the province with the highest number of sites and the best specimens of aragonite from the Keuper (Jiménez Martínez et al., 2005).

The museum's representation of items from the province of Guadalajara was approximately one third of the minerals and sites mentioned in the bibliography, and with a similar situation to Cuenca with regard to the sites from the Keuper. Additionally, during the review it was verified that 53 different mineral species were described for the highly emblematic site of the Hiendelaencina mines (Cuesta et al., 1995), representing more than twice the number of minerals inventoried in the museum at that time for the whole of the province of Guadalajara.

The province of Toledo was represented in the collection by 40% of the minerals and almost half the site.

Somewhat under one third of the minerals of interest and around half the sites in the Madrid Region were represented, although it should be noted that the basis for comparison was much more rigorous than for Castilla-La Mancha due to the existence of a monographic work on the minerals and sites in this region (González del Tánago Chanrai & González del Tánago del Río, 2002).

In regard to the information on the specimens, it was noted that there were numerous blank spaces in the fact sheets in the database. There was also uncertainty about the true nature of some specimens due to the absence of any type of clarifying analysis. The minerals were arranged in the cabinets without any clear criteria and the information on the labels was insufficient. There were also no criteria for unifying the nomenclature of the specimens. In the area of conservation, there was no knowledge of the presence of any unstable specimens, and although the environmental conditions had been monitored, no actions had yet been taken.

METHODOLOGY

Some of the methodological aspects for the refurbishment of the mineral collection of the Autonomous Regions and Cities have been published previously (González Laguna et al., 2010; Jiménez Martínez et al., 2010a; Lozano et al., 2011). The following is a summary of the methodology used:

Bibliographic study and review of external collections

The bibliographic collection consisted of assembling all the available information on the minerals and sites within the geographic scope of the work. The requirement was to compile detailed information on the mineral deposits and sites that had contributed specimens of interest, and thus identify any deficiencies that required correcting. A bibliographic study is often insufficient to determine these mineralogical resources, and it is therefore necessary to review other collections that can provide information of interest for the project. The study of external collections (public and private) contributes a real vision of the strengths and weaknesses of the IGME collection.

Specimen acquisition plan

The plan was based on four areas of action:

- 1) *in situ* collection at the sites.
- 2) exchanges with other museums and private individuals, both with the organisation itself and by participating in roundtables and in work carried out by the museum's technicians with collectors and traders.
- 3) donations, arising as a result of the direct relations between the museum's technicians and the collectors.
- 4) in last place and as an exception, the purchase of specimens, either through the usual providers or at leading mineral fairs.

Museographic elements and reorganisation

All the museographic actions have been conditioned by the priority of displaying a large number of different mineral species together with the most representative sites.

The acrylic glass blocks (where each piece is placed) were modified and a label holder in the same material was attached with Mowital B6o HH in a 20% dilution with ethanol, thus ensuring high compatibility with the acrylic over the long term and also making it totally reversible. The labels were replaced with others providing more content and including new elements such as the chemical formula of the mineral, and the name of the mine or place of origin. All the specimens in the collection were rearranged and ordered by province. Within these provinces, the fundamental criteria for the placement was the genetic type, and the specimens were grouped by sites so visitors can see at a glance the mineral groupings and parageneses in the communities considered. The bags containing the mineral specimens in the collections were replaced with low density polythene ziplock bags. The labels were also replaced.

Analysis, mineral classification and nomenclature

Due to the historic nature of the collection, some specimens were labelled with a questionable or obsolete name, as they were gathered in the field by experts in the mid-19th century, when the minerals were stored with some notations after a simple examination of the hand specimen. Additionally, today's techniques for mineral classification were unavailable. As a result of the current works of cataloguing and collecting specimens in the field, certain "problem" minerals were found that were not described in the parageneses of the sites visited, and whose verification in many cases represented one of the most important scientific contributions of this project.

The techniques used were X-ray diffraction, X-ray fluorescence (IGME laboratories in Tres Cantos, Madrid) and electron microprobe and scanning electron microscopy (National Electron Microscopy Centre at the Complutense University in Madrid).

To unify the nomenclature used in the collection, a series of guidelines was designed to allow the species name and mineral variety to be precisely assigned to each specimen.

Review, update and improvement of the database

The database required a thorough review, as there were a series of deficiencies regarding the location of the sites. The analysis of the existing information revealed that numerous specimens were incorrectly identified and many of the fields intended for the description of the specimen were blank. Some labels contained erroneous or imprecise location data.

Conservation and restoration

Since November 2006 the Geominero Museum has had a system for measuring the main environmental parameters, consisting of monitors for the uninterrupted radio recording of data on a computer system to enable their statistical analysis. Once the environmental parameters were known, a more expansive conservation plan was implemented. This involved assessing and monitoring the state of conservation of the specimens, and performing restoration work; namely surface cleaning with different reagents according to the physical and chemical properties of the mineral to be treated, and adhesions and consolidations with reversible acrylic or vinyl resins.

The main risk factors that must be considered for this collection, in order of importance, are: relative air humidity, temperature, and lighting, both ultraviolet radiation and illuminance.

The main problem observed concerned the incident light falling on the specimens, as the light fittings in place at the time did not reproduce all the colours with sufficient quality. The tubes therefore needed to be replaced with others with (Philips TLD 58/82,827) a more adequate spectral curve to ensure perfect colour reproduction (Philips TLD 90 DE LUXE PRO 58,950). The fluorescent lights

in the cabinets were also covered with transparent polycarbonate casings capable of filtering most UV radiation.

The restoration involved surface cleaning, mainly with sodium hexametaphosphate, oxalic acid, sodium bisulphate and orthophosphoric acid, occasionally supplemented with immersion in aqueous solution with common detergents and/or calgon, in an ultrasonic tank. Paraloid B,72, Mowital 60 HH and Fluormet A diluted in acetone were used for actions involving adhesion and/or consolidation.

RESULTS

The main works on Spanish mineralogy were consulted for the bibliographic review, ranging from classic 20th century guides (Calderón, 1910; Del Valle González & González Cesteros, 1990), through to the recent although still incomplete work by Miguel Calvo on minerals and mines in Spain (Calvo, 2003a, 2003b, 2006). Information was also obtained from different articles in specialised journals on Castilla-La Mancha Region (Cuesta et al., 1995; Calvo et al., 2002; Palero, 2002; González Bargueño et al., 2003; García, 2004; García et al., 2004; Sáinz de Baranda et al., 2004; Jiménez Martínez et al., 2004; Sáinz de Baranda et al., 2004; Sáinz de Baranda et al. & Viñals, 2007) and the Madrid (Vindel, 1980; García et al., 2004; González del Tánago, 1981; Locutura & Tornos, 1985, 1987; Caballero et al., 1998; González del Tánago Chanrai & González del Tánago del Río, 2002; Lozano, 2003; Jiménez Martínez et al., 2004; González del Tánago et al., 2006, 2008).

Both public and private mineralogical connections were reviewed. Four museums in the first category were examined: a) Geominero Museum (IGME), systematics collection, with almost 2,000 specimens; b) National Natural Science Museum (CSIC), with 14,000 specimens in its collection; c) Don Felipe de Borbón y Grecia Historic Mining Museum (ETSIM-UPM), with over 1,000 specimens on display and 6,500 in its collection; and d) Mineralogy Museum of the Faculty of Sciences at the UAM, with 500 specimens on display. Other public collections in secondary schools in the Madrid Region were also reviewed. This consultation

was done through the participation of the Geominero Museum in the programme of R+D activities in the Madrid Region called “Science and education in Madrid secondary schools through its cultural heritage (1837-1936)”.

Most of the private collections were consulted on the Internet (website of the Association of Mineralogy and Paleontology Museums, “FMF” forums and “Tu Planeta”).

The review of external collections identified some of the collection’s strengths, such as the extensive representation of granite specimens from La Cabrera (Madrid) and the silver mines in Hiendelaencina (Guadalajara). However, the comparison with other collections has highlighted some very significant deficiencies. Some examples are the absence of pyromorphite from the Horcajo mines and zeolites from the volcanic area of Campos de Calatrava (Ciudad Real), magnetite from San Pablo de los Montes (Toledo) and menilite opal from Agramón (Albacete). Similarly, the external reviews reveal the poor quality of some specimens such as the azurite and malachite from Pardos (Guadalajara) and the aragonites from the Keuper (Cuenca and Guadalajara). The acquisition plan has increased the number of specimens and sites represented, and most of the previous deficiencies have now been corrected.

From the start of the project, the Geominero Museum has participated in the leading forums and blogs on mineral collecting (Foro de Mineralología Formativa (FMF), MINERESP, Mineralogía Topográfica Ibérica (MTI), and Tu Planeta). This has led to contact with numerous collectors who tend to be responsible for a large number of mineralogical findings, enabling the recruitment of donors, and the exchange and purchase of minerals.

The collection, which previously contained 808 specimens, has now been enhanced by the incorporation of most of the representative minerals that were previously lacking (Figure 3), and currently comprises 4,354 specimens, representing an increase of over 400%. The number of sites has grown by over 500%, from 116 to a little over 710. Table 1 shows a comparative summary of the previous state of the collections in this study and at the end, after their refurbishment. It is worth noting the increase in the specimens inventoried in the pro-

vince of Cuenca, which has seen a rise of over 2,200%, from only 16 to 375. The greatest increase in the number of sites represented can be seen in the provinces of Cuenca with 1,050%, and Guadalajara with 794%.

Province	Specimens inventoried (Previous state-current state)	Species inventoried (Previous state-current state)	Sites represented (Previous state-current state)
Albacete	14-118	7-24	3-27
Ciudad Real	169-511	24-64	16-74
Cuenca	16-375	6-16	4-45
Guadalajara	133-872	25-65	18-161
Toledo	56-550	16-74	21-82
Madrid	420-1928	62-135	54-320
Totals	808-4354	97-201	116-709

Table 1. Comparison between the number of specimens and the species inventoried and the number of sites represented, in the previous and current states.

A total of 3,546 new specimens have been incorporated: 2,600 donations from 193 donors, 765 collected in the field, 73 from exchanges, and 108 from acquisitions. Some of these minerals come from regions other than those within the scope of the review, which has added to the supply for subsequent projects and substantially contributed to refurbishing the cabinets for other regions (Baleares and Canary Islands and the Autonomous Cities of Ceuta and Melilla).

Below is a list of the most important incorporations of specimens:

Specimens have been obtained for the province of Albacete in Castilla-La Mancha from well-known sites such as those of the Keuper in Casas de Ves, Fuentealbilla and Hellín. Other interesting additions are the sulphurs of Riópar, the copper minerals of Alcaraz and the opals from Elche de la Sierra and Agramón. Specimens from several locations have been included, as there is an abundance of iron oxides and hydroxides in this province (goethite, hematite, limonite). The scarcity of carbonate has been resolved with several specimens of dolomite and aragonite.

Specimens have been added from important sites in the province of Ciudad Real, including the cinnabar site in Almadenejos and pyromorphite from the historic mines of El Horcajo, as well as a large number of specimens from the Pb-Ag mines in Almodóvar del Campo, Villanueva de Calatrava, Cabezarrubias del Puerto and sulphurs from the Alcudia valley. Finally, there are important incorporations from the volcanic complex in Campos de Calatrava, which were not previously represented in the collection. This is significant, since almost 270 volcanoes have been recognised in the area, representing one of the most distinctive geological characteristics of the province. For this reason, some amphiboles, carbonates, olivine and several types of zeolites were added to the collection.

The collection has been enriched with a complete representation of the minerals of the Keuper in the province of Cuenca, essentially aragonites and halites from some of the most important sites in the world (Enguídanos, La Pesquera and Minglanilla). Also represented, among others, are the site of Garaballa, known for its grey coppers; the iron sites at Cueva del Hierro; and the gypsum from dozens of outcrops such as the well-known gypsum rose from the site at La Almarcha.

In the province of Guadalajara, a large number of specimens have been added from the Keuper, including some historic aragonite sites such as those of Morro Gorrino in Molina de Aragón and Estriégana. Also included are copper minerals from the well-known mine of Estrella de Pardos, the site where probably the best malachite in Spain has been collected. Some of the species incorporated from this province include pyrite, galena, freibergite, fluorite, tyuyamunite, gypsum (alabaster), siderite, staurolite, sillimanite, schorl and almandine. Finally, there are specimens from recent findings, such as goethites crystallised in calcareous nodules from Tordelrábano and dolomites, ankerites and other minerals from the iron mines in Pardos and Setiles.

For the province of Toledo, several samples of garnets (almandine) were added from the historic site at Fuente de los Jacintos (Jiménez Martínez et al., 2012a), some sulphurs and carbonates from the Minas del Guajaraz, minerals from the graphite site at Guadamur, oxides from the tin mines in the southwest of the

province, specimens from the parageneses of Pb-Ba and Cu in the area of Madrid de los Vidrios (López Jerez & Jiménez Martínez, 2013), corundums and spinels from Villanueva de Bogas, radioactive minerals from the area of Nombela and metamorphic and pegmatite species from the area of Toledo-Argés-La Puebla de Montalbán (dravite, almandine, amphiboles, biotite, muscovite, sillimanite and corundum).

For the Madrid Region, it was found that some species such as azurite, chalcocite, chrysocolla, pyrrhotite, scorodite, cerussite, chloritoid, wollastonite, serpentine, pyromorphite, pirite and vesuvianite, among others, were either not in the cabinets, or in most cases were not in the collection. Sometimes the paragenesis that was missing indicated the absence of highly important sites, as is the case of the copper mines in Colmenarejo and Colmenar Viejo, the BPGC type paragenesis in Colmenar del Arroyo, the F-Pb-Ba paragenesis in Navalagamella and the triangle formed by several towns and villages (Cadalso de los Vidrios, Cenicientos and Rozas de Puerto Real), the skarnoides and skarns from the Sierra de Guadarrama and their foothills (Colmenar Viejo, Horcajo de la Sierra, Somosierra) and others in the west with magnetite and serpentine. Other sites that were poorly represented were the gypsum sites of Villalbilla and Chinchón, the berylliferous pegmatites of Soto del Real and Guadalix, the evaporites of San Martín de la Vega, and the findings of recent decades, such as the minerals in the miarolitic cavities in the plutons in Cadalso de los Vidrios (bavenite, kamphaugite and milarite) and the discovery in La Cabrera, where dozens of species have been collected whose quality justifies their importance internationally, particularly in the case of stokesite.

The total number of specimens analysed and correctly classified was 147, among which it is worth mentioning the sulphosalts from the silver mines in La Acebeda and Horcajuelo de la Sierra (Madrid) and the copper, lead and vanadium minerals from historic mines in the province of Toledo.

New information was added, including toponyms of interest selected in the methodology, a description of the restoration procedures, the UTM coordinates, the name of the mine/ quarry and the town/community/district/village and the

F: Magnetite. San Pablo de los Montes, Toledo.

associated bibliographic references. One copy of the works featuring specimens from the museum was conserved and deposited in the library. Finally, all the specimens on display were photographed so the images could be incorporated into the database in the future.

The environmental factors monitored reveal average annual values with very low relative humidity (20-30%), rarely attaining 50%, and high average temperatures (between 20 and 25 °C), occasionally exceeding 30 ° C.

A detailed study of the specimens in the collection for Castilla-La Mancha showed that the most vulnerable species were the red silvers of Hiedelaencina (Guadalajara), the cinnabars of Almadén (Ciudad Real) and the sulphates from the Tagus basin (Toledo). It was verified that none of these species was affected in the average conditions observed in the cabinets.

Of the 115 specimens on display in the collection from Madrid, one dozen required special environmental care. Two hydrated species (chalcantite and epsomite) that were unstable in the environmental conditions in the cabinet were isolated to special microclimatic conditions to match their field of stability inside small urns with a water deposit calculated specifically for each species. The rest of the more sensitive specimens are pending more complex treatments.

DISSEMINATION OF THE RESULTS

One important goal of the refurbishment is for the mineralogical collections of the regions of Castilla-La Mancha and Madrid in the Geominero Museum to serve as an international reference for the sites and minerals present in these regions. For this reason, written material has been produced to target different types of audiences.

The partial results of the project have been presented in two international congresses (González Laguna et al., 2010; Jiménez Martínez et al., 2010a). Leaflets have been published on the minerals from the two autonomous regions inten-

ded for teachers and the general public (Jiménez Martínez et al., 2011b, 2012b). Several mineral findings have been published as part of the project: stokesite from Valdemanco, Madrid (González del Tánago et al., 2012), garnet from Fuente de los Jacintos (Jiménez Martínez et al., 2012a) and magnetite from San Pablo de los Montes (López Jerez & Jiménez Martínez, 2011), these last two in the province of Toledo. Some works have also been published regarding the dissemination of the geological heritage of Castilla-La Mancha (Jiménez Martínez & Lozano, 2009; Jiménez Martínez, 2010; López Jerez & Jiménez Martínez, 2013) and the Madrid Region (Jiménez Martínez & Prado, 2008; Jiménez Martínez et al., 2010b, 2011a; Lozano & Jiménez Martínez, 2010). The criteria for the nomenclature applied to label the collection can be consulted in Lozano et al., (2011).

Finally, the unabridged catalogue of the specimens in the collection of the Madrid Region is attached to this work (Annexed. 1). Also included is a photographic collection of the minerals from this autonomous region that are currently exhibited in the cabinets (annexed).

There are plans to post the information on the sites and mineral species from these regions on the most widely consulted international mineralogy blogs, such as “Mindat” and “WebMineral”.

ACKNOWLEDGEMENTS

The refurbishment and review of these collections was sponsored by the Spanish Geological and Mining Institute through the project “Refurbishment and enhancement of the mineral collection of the Autonomous Regions in the Geominero Museum: Madrid and Castilla-La Mancha”.

ANNEXED I

Catalogue of the collection of the Madrid Region

Shown below is the complete catalogue of the minerals in the collection in the possession of the Madrid Region.

The data shown in the catalogue have been grouped by municipal districts and arranged in alphabetical order. These include two different sites with the corresponding mineral species present and the inventory number for each specimen. Specimens from old collections for which there is no data on the site and whose morphological characters do not allow their inclusion in any known site are labelled *“specimens with no site location data”*, in clear reference to their uncertain provenance within a municipal district.

The total number of specimens inventoried is 1,928, distributed in 85 municipalities.

The total number of sites represented is 320, and the number of species represented is 135.

Alcalá de Henares

Specimens with no site location data

Celestine: M-754

Alpedrete

Canteras de Alpedrete

Albite: 9946

Calcite: 15005

Chlorite: 14970

Chrysocolla: 14972

Fluorite: 14973

Malachite: 14971

Muscovite: 15004

Opal: 14969

Canteras de Alpedrete (Cercas de Ávila)

Molybdenite: 14984

Canteras de la Dehesa

Andalucite: 15917, 15918, 15920

Quartz (Smoky): 12152

Canteras del Cañal

Molybdenite: 9855, 9898

El Cañal

Albite-Anorthite Series (Labradorite):
10032 to 10034

Aranjuez

El Regajal. Túnel del AVE

Glauberite: 17321 to 17324

Gypsum: 17319, 17320

Halite: 10933 to 10936, 14338

Braojos

El Egido. Estación de FCC de Braojos, La Serna

Quartz: 13422, (Rose: 13428, 13429)

Microcline: 13425, 13426

Muscovite: 13427

Sillimanite: 13421

Tourmaline: 13423, 13424

Buitrago del Lozoya

Embalse de Puentes Viejas

Garnet: 12147

Rutile: 10831, 12145, 12146

Río Lozoya

Almandine: 13457, 13458

Garnet: 10809

Specimens with no site location data

Quartz: 68, 1267

Schorl: 1125, 5369, 6276, 14786

Tetraedrita: 6724

Bustarviejo

El Collado

Albite: 12011, 12012

Orthoclase: 11582, 12010

Quartz: 12008, 12009

El Pinar

Quartz (Milky): 9799, 14760

Fuente del Collado

Quartz (Milky): 9245, 17269

La Alberiza

Albite: 12150, 12151

Biotite: 9836

Orthoclase: 9969

Quartz: 10057, 12015, 12016, (Smoky: 12013, 12014, 12017, 14843)

Mina Mónica. Cuesta de la Plata

Arsenopyrite: 10780, 15912

Chalcopyrite: 15913

Quartz: 12131, 12132, (Smoky: 12130)

Specimens with no site location data

Orthoclase: 1009, 1010, 1019, 1385

Cadalso de los Vidrios

Canteras de El Venero

Albite: 9986, 13195 to 13199, (Cleavelandite: 13200 to 13203)

Arsenopyrite: 11556, 11557

Bavenite: 9201, 13180, 13181

Biotite: 13192, 13193

Britholite (Ce): 17676

Calcite: 9985, 13204, 13205

Cassiterite: 15318

Chabazite: 11559 to 11561

Chalcopyrite: 13212

Chlorite: 13215 to 13219, 15319, 15919

Epidote: 11552, 11553

Fluorite: 13223, 13370

Gadolinite: 11550, 11551

Helvine: 11554, 11555, 13175, 13176, 13177

Kamphaugite (Y): 12018

Laumontite: 13224 to 13226

Microcline: 13182 to 13186

Milarite: 9295, 13194

Molybdenite: 13209, 13210, 15961

Muscovite: 13206 to 13208

Opal: 13220 to 13222

Phlogopite: 11576 to 11579

Pyrite: 13211

Quartz: 13187 to 13191, (Smoky: 9983, 9984)

Scheelite: 9356, 15316, 15317

Spessartine: 10883, 13178, 13179

Stilbite (Ca): 11558, 13213, 13214

Canteras del Lanchar de la Osa

Albite: 13526

Biotite: 13525

Chlorite: 13522

Molybdenite: 13524

Orthoclase: 13484

Pyrite: 15985

Quartz (Smoky): 13523

Minas del arroyo del Molinillo

Baryte: 9851, 10884, 10921

Galena: 9864, 9869, 10924, 10925

Siderite: 10923

Sphalerite: 9863

Canencia

Collado Bajero

Orthoclase: 9749

Cenicientos

Cerro Cabeza de la Cruz

Calcite: 10968

Orthoclase: 10963, 10964

Los Almendros

Baryte: 13460, 13461

Galena: 13459

Quartz: 10028, 12174 (Milky: 10027)

Mina del arroyo del Mancho

Sphalerite: 9952

Peñas de Cenicientos

Orthoclase: 10828 to 10830

Cercedilla

Mina las Cortes

Arsenopyrite: 13234, 13235

Chlorite: 13236

Quartz: 13233

Wolframite: 12166

Cervera de Buitrago

Casasola. Embalse de El Atazar

Ilmenite: 11566, 11567

Sillimanite (Fibrous): 10019

Dehesa del Soto. Embalse de El Atazar

Microcline: 11396, 15907 to 15911

Quartz (Smoky): 15007 to 15010,
15905, 15906

Embalse de El Atazar

Albite: 13268

Hornblende: 11540

Microcline: 10538

Orthoclase: 10511 to 10513, 10885 to
10894, 11532, 11533, 12019 to 12024

Quartz: 11534 to 11536

Sillimanite: 11539

Las Tinadas del Perdigón

Ilmenite: 11537, 11538

Staurolite: 11527 to 11531

Peña de la Hoz. Embalse de El Atazar

Chloritoid: 11568 to 11570

Staurolite: 11571 to 11575

Chinchón

Canteras del arroyo de Valdezarza

Gypsum: 9917, 10516, 10746, 10747

Minas del Consuelo

Epsomite: 10510

Glauberite: 4164, 9897, 10044 to
10049, 10839, 12506

Gypsum: 10042, 13231

Ciempozuelos

Salinas de Espartinas. Barranco de Valdelachica

Epsomite: 13238

Glauberite: 1961, 1970, 7109

Gypsum: 13239 to 13243

Quartz (Flint): 13237

Collado Mediano

El Jaralón

Quartz: 11593

Mina del arroyo de los Limos del Soto

Chalcopyrite: 12168

Mina de las Cercas de Rehoyo

Ferberite: 16083

Mina Fortuna

Fluorite: 9838, 9841

Galena: 9839

Specimens with no site location data

Wolframite: 2748

Collado Villalba

Cantos Altos

Orthoclase: 17382, 17823

Casa Aguilar

Orthoclase: 13480 to 13483, 13548

Las Suertes

Orthoclase: 11588

Los Horcajos

Illite: 9900

Quartz: 9899, (Milky: 9966, 9979)

Colmenar de Oreja

Mina Fátima

Glauberite: 11047, 14849

Colmenar del Arroyo

Mina Chaparra

Fluorite: 9912, 9958, 10496

Galena: 9875, 9879

Quartz: 9853

Mina la Carrala

Covellite: 12204

Fluorite: 6393, 10837

Galena: 12205, 12206

Sphalerite: 12202, 12203

Mina Rosita

Cerussite: 15953

Fluorite: 9955

Galena: 9956, 15952

Mina San Eusebio. La Corvera

Baryte: 12196

Cerussite: 10503

Fluorite: 10482, 10768, 10820, 10821,

13430, 13431, 14839

Galena: 9963, 12197

Minas de Nuestro Padre Jesús

Baryte: 12088

Calcite: 9954, 10812

Cerussite: 9926

Chalcopyrite: 9953

Galena: 7802, 10835, 12085

Pyrite: 9892, 10497

Sphalerite: 10771, 12086

Pozo Corvera

Baryte: 15923, 15928

Calcolpyrite: 15924

Fluorite: 12178, 12179

Galena: 12180, 15926

Sphalerite: 15925, 15927

Colmenar Viejo

Alto Eugenio

Diopside: 12162

Grossular: 9884, 9885, 9932

Wollastonite: 10498

Cancho El Escorial. Cerro de San Pedro

Sillimanite: 14014

Cerro de San Pedro

Quartz: 13437 to 13439

Las Dehesas

Quartz: 14985

Dehesa de Navalvillar

Beryl: 14021

Las Llanillas

Tourmaline: 13291

Minas del Arroyo Cantalojas. Dehesa de Navalvillar

Arsenopyrite: 12099

Fluorite: 9913, 9918, 9951, 12095 to 12099

Malachite: 12098

Pyrite: 12100 to 12102

Mina del Arroyo del Pocito de los Lobos

Chalcopyrite: 10743, 10744

Malachite: 12163

Mina Asturias. Arroyo del Jaramillo

Cassiterite: 12140, 12141

Wolframite: 12142

Mina Navarroslillos

Chalcopyrite: 9933

Chrysocolla: 10823

Mina San Marcelino. Cerro de Peñalvento

Chrysocolla: 10822, 12138, 12139

Pseudomalachite: 12137

Navallar

Arsenopyrite: 15665

Scorodite: 15666

Specimens with no site location data

Baryte: 6812, 15596

Quartz: 46, 65, 14768

Colmenarejo

Barranco de Valbedillo

Apatite: 13286

Chlorite: 13285

Muscovite: 13283, 13284

Schorl: 9972

Cuesta Blanca

Quartz (Milky): 9870

El Chaparral. Embalse de Valmayor

Quartz: 17253, 17254

La Presa

Quartz: 13541, (Crystal: 2091, 9205, 9206, 9258 to 9262, 9788), (Milky: 9255 to 9977)

Mina La Liebre. Pedazo del Toro

Azurite: 12169

Chalcanthite: 12170

Chrysocolla: 12171

Mina María

Azurite: 9935, 12078

Chalcopyrite: 12081

Chrysocolla: 12079, 12080

Malachite: 9905, 12076, 12077

Metatorbernite: 12082, 12083

Torbernite: 12084

Mina Pilar

Agardite (Y): 12089

Arsenopyrite: 10777

Azurite: 10495, 10773, 10840

Chalcanthite: 9922, 10488, 10499

Chalcopyrite: 4030, 10770, 13538

Covellite: 9959, 9960, 13539

Malachite: 10502, 10701, 10702, 10767, 11587, 12091, 13267

Mixite: 10913

Olivenite: 10912

Pharmacosiderite: 10504, 10781, 13540, 14845

Siderite: 12090

Specimens with no site location data

Quartz: 6904

El Berrueco

Cantera de Los Taberneros

Albite: 9883

Axinite: 9848, 9849

Beryl (Aquamarine): 11549

Biotite: 11541, 11542

Calcite: 9694, 9760, 9763, 9806, 9809, 9812, 9860, 9862, 9876, 9921, 9936, 9939, 9949

Chalcopyrite: 13542

Chamosite: 11543 to 11547

Chlorite: 16056, 16057

Datolite: 14215 to 14218

Epidote: 9722, 10505, 11548, 13543, 15086, 15087

Fluorapophyllite: 1495, 1499, 9698, 9699, 9866 to 9868, 9881, 14767
