MANUFACTURING AND ECONOMIC DEVELOPMENT IN THE WORLD FOR 2000-2015: MAIN FEATURES AND CHALLENGES

GUISAN, Maria-Carmen

Faculty of Economics. University of Santiago de Compostela (Spain)

Abstract:

We analyze the evolution of manufacturing and non manufacturing activities in 132 countries for the period 2000-2015, including a summary based on 4 previous studies. For the period 2000-2010 we find that the average real value-added of manufacturing per capita in Africa has been very low in both years, from 278 to 282 Dollars at 2005 prices and PPPs. The average of Asia has increased from 903 in year 2000 to 1443 in year 2010. The averages of America and the group of Europe and Eurasia have reached values higher than 3000 both in year 2000 and 2010, with a slight decrease for the period 2000-2010. We include the estimation of an econometric model to show the positive impact of manufacturing on non-manufacturing production and on economic development. This results, as well as other studies, are an strong support to the Kaldor's perspective on the important role of industry on economic development. In order to reach the Social Development Goals (SDGs) of the United Nations, we think that it is important to increase the presence of this type of studies and economic policies related with World development in the televisions, newspapers and other social media, in order to foster international cooperation to the eradication of poverty and increase of quality of life.

JEL Codes: C21, C5, L6, N62, N64, N65, N66, N67, O57

Keywords: World Development, Manufacturing, Industry, Africa, America, Asia-Pacific, Europe, Eurasia.

1. Introduction

This study presents an overview of the main challenges of World development related with manufacturing, education, investment and quality of life. These variables are of uppermost importance to foster sustained and sustainable development.

Here we focus particularly on the evolution and challenges of manufacturing all over the World, but also we cite some studies related with other main factors of development. It has been possible thanks to many years of research devoted to select relevant and accurate data, and empirical investigation analyzing direction of causality in economic development, and analyzing and estimating econometric models and other empirical research.

Section 2 presents a review of the literature, particularly of studies related with the Kaldor's perspectives on the important role of industry on the evolution of productivity and development.

Section 3 presents an overview of manufacturing and World development in year 2015, and section 4 the evolution of 132 countries for the period 2000-2015.

Section 4 includes a summary of econometric models by area, based on previous studies, and the estimation of a cross-section model of 132 countries, that show the positive an important impact of manufacturing on the real-value-added of non-manufacturing sectors.

Section 5 presents the main conclusions and several Annexes provide supplementary information, data series and comments on some readers related with special cases. If we conclude that a great concern to eradicate poverty should be made favouring manufacturing and international cooperation. A great challenge is how to get this important question to be present on the social means of communication and policies.

2. Revision of the literature

There are many factors, theories and empirical studies that can help to find solutions to poverty and favour sustained and sustainable World development, but few people speaks about how to solve the current problems, both in academic environments and in television, newspapers or other means of social communication.

After the declarations of the Millennium Development Goals (MDGs) and the Sustainable Development Goals (SDG) of the United nations, addressed to eradication of poverty, decent work and development, it is important to promote debates about the international cooperation to development based on the analysis of indicators and measures addressed to effective increase of development.

One author of great relevance in this regard has been Kaldor, with his analysis of the role of industry on economic development and increase of productivity. Klein has analyzed the role of demand and supply and several authors have studied the role of education on development.

Nowadays the theories related with the role of education have been accepted for a a wide percentage of economists and politicians, but the importance of industrial development is, unfortunately, very often missing in many economic analysis and policy measures for development.

In previous studies we have analyzed the evolution of industry and development, for the periods 1980-1999 and 2000-2010 in countries of Africa (Guisan and Exposito (2002) and Guisan(2017)), America (Guisan and Aguayo (2002) and (2015)), Asia-Pacific (Guisan and Exposito (2003) and (2015), Europe and Eurasia (Guisan and Aguayo (2003) and Guisan(2017). Here we present a summary of the main features of the evolution for the period 2000-2015 in countries of Europe and Eurasia, America, Africa and Asia-Pacific.

We have found empirical evidence that supports the Kaldor´s laws that express the positive role of industrialization on economic development. Several econometric studies, like those cited in the bibliography, show that inter-sectoral relationships are important for economic development, and that industry and foreign trade are, usually, of uppermost importance in this regard.

As seen in Valadkhani(2005) and Guisan and Exposito(2017) from a macro-econometric point of view we select the perspective of disequilibrium models from supply and demand, including the role of industry and foreign trade as important variables, not only from the demand side but also from the supply side. Guisan(1980), (2005) and (2013) and Welfe(2011) present interesting econometric models in this regard.

Some recent studies related with the role of industrial development in different areas of the World are the following ones:

Guisan, M.C. (2008) analyses de the positive impact of manufacturing on economic development in Europe, America, Africa and Asia-Pacifi for the period 1999-2006.

Kniivila, M. (2007), insists of the importance of industrial development on economic growth and its implications for poverty reduction. Analyses the cases of the following countries: Brazil, Mexico, China, Indonesia, India, Japan and Taiwan.

Hofman, Aravena and Friedman (2017). Analyze the sources of Productivity and Economic Growth in Latin America and the Caribbean, 1990-2013, and conclude that "While some services, such as telecommunications, can contribute to the growth of productivity, it can be difficult to improve productivity in certain services. Moreover, once a certain production level has been reached, there may be limited opportunities to continue growing at high rates".

In fact we notice that several empirical studies confirm that very often there is little increase of productivity in Services when the industrial development is low, while the increase of real value-added per capita in the Industry usually increases real income of families what is an important variable that contributes to increase expenditure on Services and to increase the productivity of labour and capital. The increase of real value-added per worker in Services depends, at a great extent, of the demand side, when the customers are richer and can demand more and better Services.

Ndikumana, L.(2005) Can Macroeconomic Policy Stimulate Private Investment in South Africa? New Insights from Aggregate and Manufacturing Sector-Level Evidence. Political

Page (2011) promotes that Africa should industrialize and says: "Without structural change it cannot sustain recent growth. Economies with more diverse and sophisticated industrial sectors tend to grow faster. But since 1980 Africa has deindustrialized. The paper shows that between 1975 and 2005 the size, diversity and sophistication of industry in Africa have all declined. An industrialization strategy containing two elements is needed. The first is straightforward: refocusing current investment climate reforms on infrastructure, skills, and regional integration. These actions alone will not be sufficient, however. Africa must also learn to compete through strategies to create an export push, develop industrial clusters, and attract task-based production".

We agree with his concern about the low levels of manufacturing in many African countries, and the need to foster international cooperation to development in Africa.

Finally we mention here some quantitative studies related with industrialization in several areas of the World:

Guisan(2011) analyses the role of industry and fair competition on economic development of OECD countries, with concern about the excessive austerity policy of the European Union which did not help to economic development and have implied stagnation and even diminution of production per capita in some cases.

Guisan and Cancelo(2005) analyses the effects of industrial development on productivity, employment and development in 96 European regions.

Guisan and Aguayo (2001) and (2015) analyse, respectively, the evolution of industry in American countries for 1980-1999 and 2000-2010. In the latter study they conclude: "We find that the average of America experienced a diminution in domestic manufacturing per head, from 3312 Dollars at 2005 PPPs in year 2000 to 3052 in year 2010. In spite of the high levels of the United States and Canada, and the evolution around World average of many Latin American countries, we find poverty and lack of industrialization in many countries, particularly in those with manufacturing values below World average. The main causes of the low values of manufacturing are related with the educational level of population and with the circumstances that do not favour investment. It is of uppermost importance to diminish financial risk, through national and international guarantees, in order to favour international investment and other ways of cooperation to development".

Guisan and Exposito (2002) and (2015), respectively, analyse industry in Africa for the period 1980-1999 and for the period 2000-2010. They analyze manufacturing in countries of Asia-Pacific and conclude: "The main purpose of this study has been to evaluate the real evolution of manufacturing and development in 30 countries of Asia-Pacific during the period 2000-2010. We find that each country, and the average, has experienced an important increase. The increase in China and India has been very important. The impact of manufacturing on non manufacturing activities has been positive and significant.... In spite of the positive evolution, the average of Asia-Pacific is below World average and it

should be convenient to increase both manufacturing and non manufacturing activities in many countries of this area, particularly in those with the lowest values"

Guisan(2017 a, b) analyzes the evolution of real value-added of Manufacturing in Africa and in Europe and Eurasia, and recommends to increase sustainable and sustained economic development with higher levels of manufacturing per head.

Guisan, M.C. (2011) urges to develop international policies of cooperation to foster investment per capita In this study the author presents comparative data for 21 areas and 132 countries worldwide, in order to assess the evolution of investment, production, poverty and international development. The main conclusion is that economic development for the period 2000-2010 was not enough to get fast improvements on economic development and poverty diminution in many less developed countries. It is urgent to design more cooperative policies in this regard, in order to increase education, production and investment in many areas and countries.

Education is important to increase investment per head, because the educational level of population has several positive effects, moderating excessive rates of population growth and increasing real income per head, as seen in Guisan, Aguayo and Exposito(2001) and in other studies.

Health care and quality of life are very important as development goals and thus economic policies addressed to development should have into account the effects on this regard. As our main conclusion if that manufacturing production per capita should be increased in many countries, in order to reach economic capacity to eradicate poverty and improve quality of life, it is also very important to minimize the negative effects on health and quality of the environment.

WHO(2016) has published an interesting report and map with the quality of air, and other variables, all over the World. The most outstanding conclusion, in this and in other previous studies, is that besides some industrial problems there are also other factors of contamination linked to the increase of population in non-industrial environments. In fact the most contaminated areas of the World correspond very often to countries with low levels of industrial development. The Director of Public Health, Environmental and Social Determinants of Health, in the Preface of that report (see Neira(2016)) says: "Only one person in ten lives in a city that complies with the WHO Air quality guidelines.... Air pollution continues to rise at an alarming rate, and affects economies and people's quality of life; it is a public health emergency.... WHO has responsibility for stewarding three air pollution-related indicators for monitoring progress ... in health (Goal 3 of the SDGs), in cities (Goal 11) and in energy (Goal 7)... Saving people's lives is the overarching aim to implemente policies aiming at tacking air pollution in the health, transport, energy and urban development sectors".

Education contributes to foster cooperation for health and environment quality, contributes to moderate excessive average fertility rates in many areas, to give priorities to economic policies addressed to improve quality of production and increase of productivity and real income per head, and has also other positive effects on development as seen in Guisan and Neira (2006), and in Guisan and Aguayo (2011) and in other studies.

Manufacturing should be more addressed to the domestic demand of countries and nearby areas, focused to economic development. Foreign trade may be useful to export what is in excess of supply and to import what is in shortage in the country. Manufacturing is important both in developed and developed countries. This means that to reach the SDGs (objectives of the United Nations) globalization should be reshaped, with more focus on economic development and quality of life both instead of globalized markets at the service of ambitious profit-seekers. The great challenge is to get more televisions and newspapers focusing more on education, investment and development.

3. Manufacturing and World Development in 2010-2015, at 2011 prices and PPPs.

Table 1 presents the list of 132 countries of this study, in descending order accordingly to their value-added of manufacturing per head in year 2015. In comparison with year 2000 there have been several remarkable changes, with countries that have diminished their manufacturing activity per head and other ones that have increased this activity and have moved to the highest levels of the ranking.

Table 1. Manufacturing Value-Added per head in year 2015 (Dollars at 2011 prices and PPPs)

Group	Qmh 2015	Countries

*Not available at WB(2017) World Development Indicators on 12th October 2017 for year 2015 nor year 2010. In the cases of Canada, Romania and Venezuela we classified the country accordingly to their available data of year 2010.

Accordingly to several econometric studies that relate manufacturing and non manufacturing activities, as those cited in the bibliography, there is a strong empirical evidence in favour of Kaldor's laws of industrialization as a motor of development of services and an important factor in the increase of labour productivity. Of course there are other important factors that have a positive impact on Services and other non-manufacturing activities, like energy, tourism, harbour activities, foreign trade and other ones.

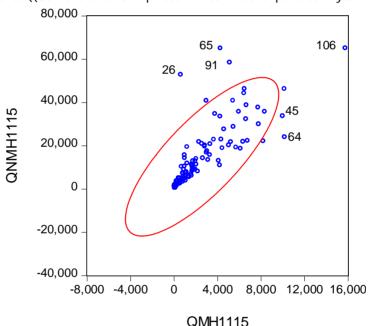

Graph 1 shows the high correlation between QMH (value-added per head in manufactugin) and QNMH (value-added per head in non-manufacturing activities), with a correlation of 78%. This graph is based on 112 observations of the countries with

available data in table 1 excluding Ireland due to the strong and sudden increase of QMH in year 2015, which is commented in the Annex.

There are a few outliners that are not included in the confidence ellipse:

- 1) Three countries or territories with levels of QNMH higher that expected as function of QMH: These are the cases of countries 65 (Kuwait) and 91 (Norway), explained by the energy sector (not included in manufacturing) and the special case of the territory of Hong-Kong in China, with a lot of services and exports activities based on the manufacturing activities of other Chinese regions.
- 2) Two countries with a high level of manufacturing per head and a level of development of services in the domestic market lower than expected: country 45 Germany and country 64 Korea R. It happens that some countries with a high level of manufacturing invest and spend in Services, or other activities, in non-domestic markets, and they usually have a highly positive NIP (Net International Position).

Graph 1. Manufacturing (QMH) and non Manufacturing (QNMH) per head in 112 countries ((US Dollars at 2011 prices in international parities in year 2015)

Note: Numbers of countries outside the confidence interval: 26 (China Hong-Kong), 45 (Germany), 64 (Korea R.), 65 (Kuwait), 91 (Norway), and 106 (Singapore).

4. Manufacturing and World development in 2000-2015, at 2005 prices and PPPs.

Table 2 shows the average results by big areas and continents of the evolution of real value-added of Manufacturing per head (QMH) and real Gross Domestic Product per head, in Dollars (USD) per capita at 2005 prices and Purchasing Power Parities (PPPs).

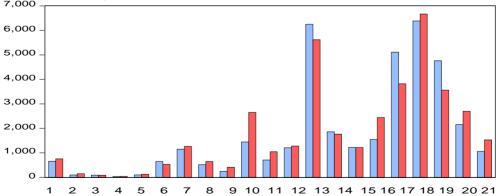

Graph 2 shows the great differences among 21 areas of the World in the degree of development of Manufacturing per head. The highest values correspond to areas 13 and 18, followed by 17 and 19. The highest increases for the period 2000-2010 corresponded to area 10 (China and North East), area 15 (South West Andean America) and area 20 (Central Eastern Europe).

Source: Guisan(2014) from WB statistics. List of countries of each area in Annex 2.

Graph 2. QMH in years 2000 and 2010: 21 areas 7,000

Source: Elaborated from Guisan(2014). Areas are in the order of table 2, where is the name of each area. See Annex 1 for the lists of countries by area. Areas 1 to 7 correspond to Africa, 8 to 12 to Asia and Pacific, 13 to 16 to America, and 17 to 21 to Europe and Eurasia.

We may notice great differences by area and continent in the degree of industrialization related with Manufacturing, with very low values in African average with less than 300 Dollars both in year 2000 and 2010. We may notice an increase in Asia-Pacific from 903 to 1442 Dollars per capita in the period 2000-2010. The averages of America and of the group of Europe and Eurasia, have experienced an small decay in that period, being both values slightly over 3000 Dollars. The World average has increased as a consequence of the increase in Asia-Pacific.

Tables 3.1 to 3.10 show the evolution of production per capita (net production measured by real-value-added per head) of Manufacturing (QMH) (non-Manufacturing (QNMH) and total production per head (PH). Data are expressed in Dollars of the United States (USD) at 2005 prices and PPPs). Data of the period 2000-2010 have been elaborated from World Bank statistics by Guisan and Aguayo(2015) for American countries, Guisan and Exposito (2015) for Asia-Pacific and Guisan(2017 a,b) for Africa, Europe and Eurasia. Data for year 2015 have been elaborated fo this study as explained in the Annex. For the 20 countries with problem of not availability of data for the year 2015 we indicate as "NA, and we expect to update the information in the Annex in the future.

Source: Elaborated by M.C.Guisan from WB statistics. See Annex. Not Available = NA.

The top countries by Production per head in year 2015 where already prosperous in year 2000. Nine of them have a high value of manufacturing per head, over 4800 Dollars at 2005 prices and PPPs in year 2015.

In three cases the high value of production per head is, at a great extent, explained by the positive effects of energy industry, not included in manufacturing, as it happens in Australia, Kuwait and Norway. There are also one special cases of the Chinese territory of Hong-Kong with low value of industrial production per head but with a great activity exporting industrial production from other Chinese areas.

Manufacturing production per head has experienced a great increase in Ireland, as explained in the Annex. In the other cases of table 3.1 there has been little change for the period 2010-2015.

Table 3.2. Production per capita between 25000 and 35000 Dollars at 2005 prices and PPPs

Two countries of this group have increased Manufacturing production per head for the period 2000-2010 and 2010-2015: Slovenia and Korea R. Seven European countries of this group have experienced important decreases of Manufacturing production per head for 2000-2010 and/or 2010-2015: Italy , Spain, France, Finland, Denmark, Belgium and the UK. Some of them have experienced a decrease of total production per head for the period 2000-2010 (Italy) or 2010-2015 (Italy, Spain and Finland). Austerity policy have been excessive in the European Union, for several reasons as we comment in the Annex.

Several countries of this group have experienced important increases of Manufacturing and total Production per head for the period 2000-2010 and 2010-2015, as they are the cases of Hungary, Lithuania, Estonia, Poland, Slovak R. and Czech R., all of them with an increase higher than 5000 Dollars of total Production per head for 2000-2015.

Other countries of this group show stagnation, both in Manufacturing and Total Production per head, as they are the cases of Greece and Portugal. Saudi Arabia an increase of Manufacturing and total production.

The highest values of Manufacturing per capita of this group in year 2015 correspond to Belarus, Malaysia and Turkey, followed by Mexico, Bulgaria, Argentina and Russian Federation. Three countries of table 3.4 have experienced an important increase of Manufacturing per capita higher than 1000 for the period 2000-2015: Bulgaria, Belarus, Turkey. They have experienced important increases of total Production per head: around 6000 in Bulgaria, more than 7000 in Belarus and in Turkey. A few countries have a high level of non manufacturing production in spite of low or very low values of manufacturing per head. They are special cases like Panama, with a high level of activity in Services related with the Channel, and Botswana which impressive development has been founded in diamond production and other mining activities, as cited in the Annex. The lowest increase, below 2000 Dollars, of total production per head in table 3.4 correspond to Mexico. It is particularly important for Mexico to increase industrial production per head in order to foster economic development.

The highest increase of manufacturing per capita, for the period 2000-2015, in table 3.5, correspond to Dominican R. with almost 1000. Non Manufacturing per head have increased in all the countries with available data of this table, due to other factors like tourism, but to foster sustained economic development all of them need to increase manufacturing production per head.

The countries with available data for year 2015 in table 3.6 that experienced an increase higher than 500 Dollars in Manufacturing per head for the period 2000-2015 have been Georgia, and Thailand. China has experienced an increase higher than 1000 Dollars for the periodo 2000-2010. Other countries have experienced smaller increases or stagnation, and only one country (South Africa) has experienced a decrease of Manufacturing per head. Some countries of this group have experienced high percent increases of total Production per head, what is an important step for a process of sustained development.

Table 3.7 includes countries with levels of development below World average (Production per head 9852 Dollars in year 2015). All the countries of this group with available data

have experienced a positive evolution of Manufacturing per head and total Production per head for the period 2000-2015. Increases higher than 200 Dollars in manufacturing per head correspond to: India, Congo R., Philippines, Jordan, Indonesia, Morocco, Mongolia and Sri Lanka. It is important to foster manufacturing to get sustainable development and poverty eradication.

Countries of table 3.8 had very low levels of total Production per head in year 2000. Some of them, among those with available data in year 2015, have experienced an increase higher than 1000 Dollars for the period 2000-2015: Myanmar, Cambodia, Lao PDR, Nicaragua, Moldova and Vietnam, and other ones have experienced smaller increases. All the countries of this group have very low levels of manufacturing per head.

The only country of tables 3.9 and 3.10 that have experienced and increase of total production per head higher than 1000 Dollars, among those with available data for the period 2000-2015, has been Bangladesh. It is outstanding the need to foster development in all the countries of these areas, particularly in those with the lowest levels.

Table 3.10. Countries with production below 1000 Dollars at 2005 prices and PPPs

5. Econometric models: manufacturing and World development in 2000-2010

As seen in the economic literature cited in this study, several empirical studies have shown, form a perspective of disequilibrium, that both demand and supply are important for development and that supply of intermediate inputs is related with domestic production of raw materials and other intermediate goods and with the capacity to import intermediate inputs not available in the domestic market. As seen in Guisan(2013) the capacity to import usually depends on the capacity to export in order to avoid unsustainable trade deficits. For the purposes of simplification the estimated models that we summarize here do not include the effects of foreign trade, and focus mainly on the effects of manufacturing on non manufacturing activities.

Table 4 presents the results of estimation of a mixed dynamic model, where real Value-Added per head (QNMH) is expressed as a function of its lagged value and the increase of OMH.

Table 4. Econometric models for the period 2000-2010

	Lagged dep.variable	Increase of QMH	R ²
Africa	1.203965	3.582825	0.996992
America	1.201132	2.351296	0.991983
Asia-Pacific	1.253758	0.930252	0.996193
Europe and Eurasia	1.222405	2.541376	0.980595
World	1.222653	2.48 (or 1.04, See Note 1)	0.991372

Notes: ¹ As seen in the Annex we have tested the homogeneity of the coefficient of the increase of QMH in the equation of QNMH among different areas, and we have found a significant difference, with a value for Asia-Pacific lower than in other areas.

A most complete analysis should include other variables like the increase of Exports and Imports, as indicated in Guisan(2013) and other studies, but this simple model is enough to show the high degree of dependence of many non Manufacturing activities on the degree of industrial development:

QNMH f(QNMH(-1), D(QMH))

Being D(QMH)=QMH-QMH(-1). The lagged values of each variable, in t-1, are indicated with (-1) within parenthesis.

The estimation results are presented in the Annex and show that all the coefficients are significant and positive. The goodness of fit is very high in all the cases, in spite of the simplified version of the model, because the effects of missing variables are linearly correlated with the included explanatory variables. The effects of missing variables does not diminish the goodness of fit when they are highly correlated with the included variables as seen in Guisan(1997, chapter 5).

6. Conclusions

The main object of this report is to compare the production per head in 132 countries and to analyze the positive effect of manufacturing on development. We have elaborated values per capita, for the period 2000-2015, in a common currency at constant prices (USD at 2005 PPPs) and include tables in the Annex. We find that the average of real value-added per capita in Africa has been very low in both years, from 278 in year 2000 to 282 in year 2010. The average of Asia has increased from 903 in year 2000 to 1443 in year 2010. The averages of America and the group of Europe and Eurasia have reached values higher than 3000 both in year 2000 and 2010, with a slight decrease for the period 2000-2010. It is important avoid stagnation or decrease in order to foster domestic development.

The econometric models show the positive and significant impact of manufacturing on non-manufacturing production and on economic development. It is important to increase the presence of this type of studies and economic policies related with World development in the televisions, newspapers and other social media, in order to foster international cooperation to the eradication of poverty and increase of quality of life.

Annex 1.

Countries in Areas of Africa:

- 1. Northern Africa: Algeria, Egypt, Mauritania, Morocco and Tunisia.
- 2. North Western Africa: Cote d'Ivoire, Ghana, Guinea, Nigeria, Senegal, Sierra Leone, Togo
- 3. Sahel and Central Africa: Burkina-Faso, Burundi, Cameroon, Central African R., Chad, Congo D.R., Congo R., Mali, Niger, Rwanda.
- 4. North Eastern Africa: Eritrea and Ethiopia.
- 5. Eastern Africa: Kenya, Madagascar, Tanzania, Uganda
- 6. *Southern Africa*: Angola, Botswana, Lesotho, Malawi, Mozambique, Namibia, South Africa, Zambia and Zimbabwe.

Countries in Areas of Asia-Pacific

- 7. Western Asia: Israel, Jordan, Kuwait, Lebanon, Saudi Arabia, Syria and Yemen.
- 8. South Central Asia: Afghanistan, Iran and Pakistan.
- 9. India and South: Bangladesh, India, Nepal and Sri Lanka.
- 10. China and North East: China, Hong-Kong, Japan, South Korea and Mongolia.
- 11. Indochina or South East: Cambodia, Lao, Myanmar, Thailand and Vietnam.
- 12. South Pacific: Australia, Indonesia, Malaysia, New Zealand, Papua-New Guinea, Philippines and Singapore.

Countries in Areas of America

- 13. USA and Canada
- 14. *Mexico and Central America*: Costa Rica, Dominican R., El Salvador, Guatemala, Haiti, Honduras, Jamaica, Mexico, Nicaragua and Panama
- 15. West South America (Andean America): Bolivia, Chile, Colombia, Ecuador, Peru, Venezuela.
- 16. East South America: Argentina, Brazil, Paraguay and Uruguay

Countries in Areas of Europe and Eurasia

- 17. Nordic and British Europe: Denmark, Finland, Ireland, Norway, Sweden, United Kingdom
- 18. Central-Western Europe: Austria, Belgium, Germany, Netherlands and Switzerland.
- 19. Latin Europe: France, Italy, Portugal and Spain
- 20. Central-Eastern Europe, Baltic and East Mediterranean. Includes East Central Europe: Czech Republic, Hungary, Poland, and Slovak. Baltic countries: Estonia, Latvia, and Lithuania. East Mediterranean: Albania, Bulgaria, Croatia, Greece, Macedonia, Romania and Slovenia. In this area we also include Turkey, an Eurasian country that belongs to the Council of Europe.
- 21. Russia and CIS: Includes 3 East European Countries: Belarus, Moldova and Ukraine, 4 Eurasian countries, which belong to the Council of Europe: Russia and the 3 Caucasus countries (Armenia, Azerbaijan, and Georgia), and 5 Central Asian countries which belong to the Community of Independent States (CIS): Kazakhstan, Kyrgyz Republic, Tajikistan, Turkmenistan and Uzbekistan.

Annex 4. Mixed dynamic model relating QNMH and QMH

Here we include the results of the model summarized in table 4. They include besides the main variables (QMH and QNHM some dummy variables with a value equal to unity for special countries and equal to zero in other cases. The estimations of Africa, America, Asia-Pacific and the group of Europe and Eurasia are based on previous studies, indicated as source, and the estimations with the World sample of 132 countries are presented here.

Source. Guisan(2017 b).

In these results we find an estimated coefficient for the lagged variable very alike in all the regressions, with little differences among the geographical areas, but there are more differences in the case of the coefficient of the increase of QMH.

Log likelihood	-1100.401	Hannan-Quinn criter.		16.98508		
Durbin-Watson stat	1.786643					

DAS is a dummy which is equal to 1 for countries of Asia-Pacific and zero in other cases. The coefficient is significant and negative showing that the impact of manufacturing on non manufacturing activities is, on average, lower in Asia-Pacific (2.486762-1.443629=1.043133) than in other areas of the World (2.486762).

Coefficients of country dummies for special cases in World Model 2.

We have tested the homogeneity of this coefficient in the World regression with 132 countries and find that we can reject the homogeneity in the case of Asia, being the estimated coefficient lower in that case. This may due to different causes as for example to the effect of missing relevant variables. As seen in Guisan(1997) the effects of missing variables affect to the estimation of the coefficients of included variables that have high degree of correlation with the missing ones. The important question is that in all the cases the effect of QMH is highly positive.

Annex 5. Suggested news and readings on the evolution of some countries and the UN Sustainable Development Goals.

https://en.wikipedia.org/wiki/Economy_of_Botswana

Botswana's impressive economic record has been built on a foundation of <u>diamond mining</u>, prudent fiscal policies, international financial and technical assistance, and a cautious foreign policy. It is rated the least corrupt country in Africa, according to international corruption watchdog, <u>Transparency International</u>. By one estimate, it has the fourth highest <u>gross national income</u> at <u>purchasing power parity</u> in Africa, giving it a standard of living around that of Mexico and Turkey. [10]

Annex. Special increase of GDP of Ireland in year 2015 http://www.abc.es/economia/abci-irlanda-crecio-263-por-ciento-2015-201607122102 noticia.html

http://www.cso.ie/en/releasesandpublications/er/iips/irishindustrialproductionbysecto r2015/

Value of Products manufactured and sold by Irish based enterprises rose 12.9% to €115.6 billion in 2015

The total value of products manufactured in Ireland in 2015 was €115.6 billion. This was an increase of 12.9% on 2014 figures. See Table 1.

Significant growth in Ireland's top industries

The Chemical and Pharmaceutical sectors recorded the biggest percentage increase in NSV in Ireland between the years 2013 - 2015. The Chemical sector experienced 51.8% growth while the Pharmaceutical sector had 46.9% growth.

The value of Food products manufactured in the same time period rose 8.2% while the Computer, optical and electrical equipment sector grew by 37.5% in NSV terms. Elements of these percentage changes are attributable to NACE changes as a result of some enterprises being reclassified from the Services sector to the Industrial sector. See Figure 4 and Table 1.
