

La población y tasas vitales de las misiones jesuíticas de los Guaraní (Argentina, Brasil, Paraguay)

The population and vital rates of the Jesuit missions of the Guarani
(Argentina, Brasil, Paraguay)

Robert H. Jackson^{*}

Resumen: Este es el segundo de tres artículos que presenta información sobre la población y tasas vitales de las misiones jesuíticas de la provincia de Paraguay reconstruido de censos.

Palabras clave: Argentina, Brasil, Paraguay, tasas vitales, población

Abstract: This is the second of a series of three articles that present information on the population and vital rates of the Jesuit missions in the Paraguay province reconstructed from censuses.

Key words: Argentina, Brasil, Paraguay, vital rates, population

La base del estudio de los patrones demográficos de las poblaciones históricas es la reconstrucción de las tasas vitales, de las tasas de natalidad y de mortalidad. En 2015, publiqué un estudio demográfico de las misiones jesuitas de Paraguay y Chiquitos en inglés titulado *Demographic Change and Ethnic Survival among the Sedentary Populations on the Jesuit Mission Frontiers of South America: The Formation and Persistence of Mission Communities in a Comparative Context.* El libro reconstruyó las tasas vitales de estas comunidades misioneras utilizando censos y los registros bautismos y entierros existentes. El propósito de estos artículos es poner esta información a disposición de un público más amplio en español.

Este artículo no ofrece un análisis detallado de los patrones demográficos de las misiones entre los Guaraní. Baste decir que las poblaciones de las misiones fueron de alta mortalidad y alta fertilidad, y en la mayoría de los años las tasas de natalidad fueron más altas que las tasas de mortalidad. Las epidemias se extendieron a las misiones por las vías fluviales, y alcanzaron los niveles catastróficos e en algunos casos más de 50 o 60 por ciento de las poblaciones. Sin embargo, las poblaciones recuperaron después de los brotes y crecieron a través de la reproducción natural con la formación de nuevas familias y tasas altas de fertilidad. Para una discusión más detallada de los patrones demográficos en las misiones jesuitas entre los Guaraní, remito al lector a una serie de mis publicaciones sobre este tema. Ver Jackson (2004, 2005, 2007, 2008, 2014, 2015B, 2015B). Otros estudios sobre las poblaciones de las misiones incluyen las de Maeder y Bolsi (1976, 1978, 1980, 1982), y la el artículo de Massimo Livi-Bacci y Maeder (2004), entre otros estudios.

Las fuentes demográficas históricas podrían tener deficiencias, como subenumeraciones porque la gente no tenía dinero para pagar a un sacerdote para administrar sacramentos o porque un censo estaba preparado para propósitos de impuestos o para identificar reclutas militares o para trabajar. Incluso los censos moderados registran subenumeraciones. Los censos misioneros jesuíticos y los registros sacramentales, por otro lado, son generalmente más confiables.¹ Ninguna fuente demográfica es absolutamente exacta, pero los jesuitas no cobraron honorarios sacramentales, y los misioneros usaron fondos comunales para pagar la tribulación. Ciertamente había casos de fugitivos que salían de las misiones, pero en general los residentes de la misión no tenían las mismas motivaciones para evitar aparecer en el registro como lo hicieron, por ejemplo, las poblaciones europeas contemporáneas. Por otra parte, el análisis de los detallados censos de tributo muestra que los jesuitas pudieron seguir la pista de la población y sabían qué individuos estaban ausentes como fugitivos y por cuánto tiempo, o estaban realizando tareas lejos de las comunidades de la misión.

El análisis de los patrones demográficos de las misiones jesuíticas no puede juzgarse con normas basadas en las poblaciones europeas contemporáneas, que eran muy diferentes. Las poblaciones europeas se enfrentaron a restricciones económicas a la formación de la familia que las poblaciones de la misión no lo hicieron. Por ejemplo, la tierra era limitada en Europa, mientras que la tierra era abundante en las misiones y el acceso a la tierra no era un factor que retrasara la formación de la familia en las misiones. Las parejas europeas se casaron a una edad más tardía que en las misiones y las mujeres indígenas se casaron poco después de la pubertad alrededor de los 13 o 14 años.

¹ He empleado documentos originales en la elaboración de las tasas vitales de las poblaciones de las misiones. Sin embargo, los datos para los años 1707, 1708, 1719, 1729, 1731, 1735, 1737, 1738, y 1766 son de la Biblioteca Nacional, Rio de Janeiro, igual que un grupo de censos de Yapeyú de 1723, 1725, 1726, 1727, 1730, 1731, 1732, 1742, 1743, 1751, 1752.

La edad de fertilidad potencial era mucho más larga entre las mujeres que vivían en las misiones, lo que dio lugar a fuertes tasas de crecimiento y altas tasas De la fertilidad generalmente más alto que las poblaciones europeas contemporáneas.

Una serie de gráficos demográficos muestran la trayectoria del cambio de las poblaciones en el tiempo, los efectos de la mortalidad catastrófica, de la política jesuita de establecer nuevas comunidades mediante la transferencia de población de las misiones existentes, y la transferencia de población después de epidemias. La población de San Francisco Xavier, por ejemplo, cayó tras la transferencia de familias a Yapeyú, y los jesuitas establecieron las misiones orientales con la transferencia de población de las misiones existentes. Las tablas contienen la siguiente información: población, número de familias y número total de bautizos y entierros. Esta información se ha utilizado para reconstruir las tasas brutas de natalidad y mortalidad por mil habitantes, que es una medida estándar que permite comparar las tasas vitales en el tiempo y entre las comunidades. En otras palabras, el número de bautismos y entierros si la población era de 1.000 personas. Esto se calcula dividiendo 1000 por la población del año anterior, y luego multiplicando el número de bautismos o entierros. Durante algunos años las tasas vitales se estiman porque la información es incompleta. Esto se hace mediante la estimación de la población del año anterior por la resta de los bautismos y la adición de entierros a la población actual. La cifra final es el tamaño promedio de la familia calculado dividiendo la población total por el número de familias. Mi esperanza es que esta información sea útil para futuras investigaciones.
