

**REGIONAL EMPLOYMENT AND UNEMPLOYMENT BY GENDER IN SPAIN
IN COMPARISON WITH OTHER EUROPEAN COUNTRIES**

GUISAN, Maria-Carmen*

EXPOSITO, Pilar

Abstract

We analyze regional employment by sector and gender in Spain and found that the highest values for women participation in labour correspond to services where the rates of male and females employed people, per one thousand inhabitants, in year 2009 was 287 of which 154 (54%) are women and 133 (46%) are men. These figures are below those of the USA and advanced European countries. Employment rate per one thousand inhabitants in Spain is particularly low in Education and Health with only 46 employments per one thousand people, while in Germany and USA reach, respectively, 78 and 100. There is a high concentration of female employment in Services. We found, both at regional level of Spain and at European countries level, that industrial production has, among other factors, an important positive effect on real value-added of Services and we estimate a panel model of 7 OECD countries for the period 1994-2006.

Keywords: Regional Employment by gender, Unemployment in Spain, Employment by Gender in European countries,

JEL Codes:

1. Regional employment and unemployment by gender in Spain in year 2009**1.1. Rates of employment by gender and sector per one thousand people.**

Tables 1a and 1b present the rates of employment by sector and gender in Spanish regions, for the year 2009, per one thousand inhabitants. The rate of total employment amounted to 404 employed persons per one thousand inhabitants, of which 228 were men and 176 women.

The highest values for female employment correspond to Madrid, with 211 employed women per one thousand inhabitants, followed by Balears with 196, Cataluña with 193 and País Vasco with 192. The lowest values, below 150, corresponded to Andalucía (146), Castilla-La Mancha (149) and Extremadura (137). The difference between maximum (Madrid) and minimum (Extremadura) is 74 female employments per one thousand inhabitants.

In the case of male rates the highest value corresponded to Rioja with 251 male employments per one thousand inhabitants and the minimum to Andalucía with 206, with a difference, between both values, of 45 male employment per one thousand people.

Agriculture: The highest rates of employment in Agriculture, with more than 30 employed persons per one thousand people, were achieved in three regions: Extremadura, Galicia and Murcia. Male employment in this sector is higher than female one, with 12 men and 4 women workers per one thousand inhabitants in whole Spain.

Industry: The highest rates of employment in industry, with more than 80 employments per one thousand inhabitant corresponded to Aragón, Cataluña, País Vasco, Navarra and Rioja, with an outstanding value of 123 in Navarra. Male employment in this sector is higher than female one with 45 men and 15 women employed in industrial activities per one thousand inhabitants.

Construction: The number of employments per one thousand people of this sector in Spain in year 2009 amounted to 40 , of which 37 for men and 3 for female. The most outstanding regions where Baleares, due to touristic intensity, and Castilla-La Mancha which is a region with important demographic and touristic impacts due to its proximity to Madrid.

Services: with 287 employments per one thousand inhabitants in this sector, of which 154 corresponded to female employment and 133 to male one, it implies that 71% of Spanish workers were occupied in this sector in year 2009. Male employment outnumbered female employment in almost all regions. The highest rates of employment in Services corresponded to Madrid (373), Baleares (336), Canarias (309), Cataluña (292) and Pais Vasco (290).

Total employment: The highest rates of total employment in year 2009, with 420 or more employed persons per one thousand inhabitants, corresponded to: Aragon, Baleares, Cantabria, Cataluña, Madrid, Navarra, Pais Vasco and Rioja. All these regions have outstanding value added per capita in industry and/or tourism what imply high level of activity in many services. The lowest rates in year 2009, with 390 or less employed persons per one thousand inhabitants, corresponded to: Andalucia, Asturias, Canarias, Castilla-La Mancha and Extremadura.

1.2. Unemployment by gender in Spanish regions for year 2009.

Tables 2a and 2b present data of employment and unemployment.

Source: Data INE(2010), elaboration by Guisan and Exposito. M=male, F=Female. Unemployment rate by gender is the % of unemployment by gender on population active by gender.

There are 6 regions in table 2a with rates of male and female unemployment below 15% of the corresponding Population Active in year 2009: Asturias, Cantabria, Galicia, Madrid, Navarra, Pais Vasco and Rioja. The highest rates of male unemployment, above 25% of male Population Active, corresponded to Aragon with 31.4% and Canarias with 25.6%. The highest rates of female unemployment, above 25% of female Population Active, corresponded to Andalucia, Canarias and Extremadura. Carrasco et al (2005) found that generally Northern regions of Spain showed better opportunities for women than southern regions regarding employment, wages and other indicators.

Source: Data from INE(2010) and elaboration by Guisan and Exposito. M=male, F=Female. Unemployment rate is the percentage of unemployment by on population active. ER and PAR are, respectively the “employment rate” and the “population active rate” as % of total population.

Madrid is the most outstanding region in graph 1 with nearly 46%, followed by Baleares, Aragon, Navarra, Cataluña, Pais Vasco, Rioja, Cantabria and Galicia. There are two regions below 36%: Andalucia and Extremadura. It is important to increase employment rates in several regions, particularly in those with values below Spanish average.

Graph 1 shows the Employment Rate (ER) in percentage of total population of Spanish regions in year 2009.

Graph 1. Employments rate (ER) per one thousand people in Spanish regions, year 2009

Sources: Elaborated by Guisan and Exposito from INE statistics. See order of regions in table 2b

2. Employments by sector in Spanish regions in year 2009.

Table A1 in the Annex presents more disaggregated data for employment at nine sectors level. we may point to some features of sectoral employment in Spanish regions for year 2009:

Agriculture: With a total of 786 thousand employments of this sector in Spain, the most outstanding regions were: Andalucia, Galicia, Comunidad Valenciana (Com. Valenciana), Castilla y León and Murcia.

Manufacturing: The 7 more outstanding regions in industrial manufacturing, excluding energy, with a total of 2616 thousand employments, were: Cataluña with 23.1%, Com. Valenciana with 12.4%, Madrid with 9.6%, Andalucia with 9.5%, Pais Vasco with 7.8%, Galicia with 7.1% and Castilla y León with 6.4%.

Construction: With a total of 1888 thousand employments of this sector in Spain, the most outstanding regions were: Cataluña with 17.2%, Andalucia with 15.0%, Madrid with 13.1%, Com. Valenciana with 11.5% and Galicia with 6.1%.

Services: With 13431 thousand employments of this sector in Spain, the most outstanding regions were: Madrid with 17.6%, Cataluña with 16.2%, Andalucia with 16.0%, Com. Valenciana with 10.4% and Galicia with 5.6%.

3. Employment and unemployment by gender in Europe and the USA

Table 3 shows the evolution of employment rates by gender in Europe, USA and OECD countries, in the period 2002-2009. The highest rates for female employment, over 73% employment for female population aged 15 to 64 years, correspond to Denmark, Finland, Iceland, Norway, Sweden and Switzerland. All the countries of this group have a high degree of industrialization. The lowest rates of female employment, below 60%, correspond to Greece, Hungary, Italy, Poland and Spain, which are countries with lower degree of industrialization. Difference between male and female rates of employment diminished for the period 2002-2009, where male rate decreased from 82.1% to 80.3% and female rate increased from 59.0 to 61.3, and thus the difference evolved from 23.1 in year 2002 to 19 in year 2009.

Graphs 2 and 3 show the evolution of male and female rates of employment for population aged 25 to 64 years, in Spain in comparison with the the USA and the

European Union 15 (Austria, Belgium, Denmark, Finland, France, Germany, Greece, Ireland, Italy, Luxembourg, Netherlands, Portugal, Spain, Sweden and United Kingdom).

Graph 2. Rate of Male Employment, 1970-2009

Graph 3. Rate of Female Employment, 1970-2009

Table 3 shows that in comparison with Germany employment rates in year 2009 were lower in Spain: 57.6% for female against 69.4% in Germany, and 73.6% for male against 81.3% in Germany.

Accordingly to table 4, the main differences of Spain in comparison with Germany and the USA are the lower rates of employment of Spain in Education and Health: the sum of both sectors amounts only to 46 employments per one thousand people, while in Germany and USA are, respectively, 78 and 100.

Italy	4.90	7.90	3.00			

Source: OECDE LFS and own calculations for UR gap. See more data in Table A6 in the Annex

In a few cases female unemployment rate in year 2007 was lower than the male one: Canada, Ireland, Japan, Korea, Norway, UK and USA. The unemployment rate gap of women in relation with men was, in year 2007, 1.20 in EU27, and in Spain this gap

amounted to 4.50, being Spain the second country in descending order of this variable after Greece with 7.6%. In year 2009 the Spanish gap diminished to 0.7, given that the increase of male unemployment rate was higher than the increase of female unemployment rate accordingly to data of table 2a.

Table 6 summaries tables A4 and A5 of the Annex about the distribution by sector and branch of male and female employment in Spain in comparison with Germany and 25 countries of the European Union (EU25). In those tables we may notice that Spain shows a deficit of employments in Social Services, particularly in Education and Health, in comparison with Germany and other countries. For that reason we cannot approve stagnation or diminutions of employment in these important services.

Table 6. Male and Female employment by sector and branch in Spain around year 2008

Male employment by sector	Female employment by sector

4. The impact of industry on real value-added and employment in services.

Table 7 and graph 4 show the positive relationship between real Value-Added in Services and Industry, in 6 OECD countries in years 1996 and 2005. The highest ratios between both variables, with value higher than 4, corresponded to France with 4.26, USA with 4.10 and UK with 4.08, while in Germany and Poland the ratio was below 3, and Italy and Spain occupied and intermediate position with values between 3 and 4.

Table 7. Real Value-Added (VA) per capita in Services and Industry and Employment Rate in Services (ERS) in 7 OECD countries, 1996-2005

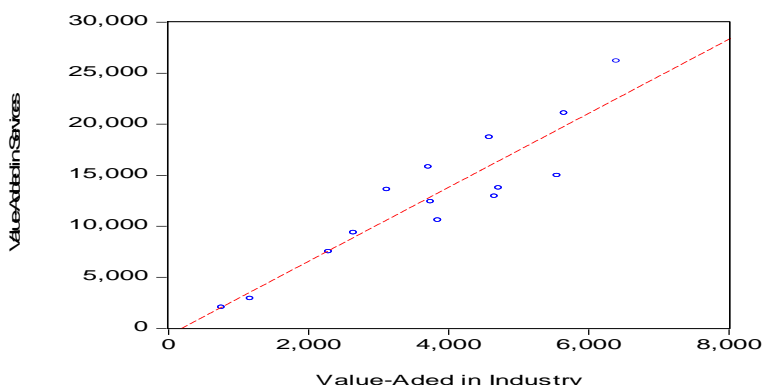

Country	VA Services 1996	VA Industry 1996	VA Services 2005	VA Industry 2005	ERS 1996	ERS 2005	VA Ratio 1996	VA Ratio 2005

Source: Guisan (2010). Elaborated from OECD National Accounts Statistics. Real Value-Added per capita in Dollars at 2000 prices and Purchasing Power Parities (PPPs). ERS = Employment Rate in Services: Number of employed people in Services per one thousand inhabitants.

Some differences among countries may be explained by different organization of business services depending on the degree of outsourcing. If a great percentage of business services in industrial firms are provided by own workers it has a positive effect

on industrial employment but if the industrial firms request business services in the free market for services it has a positive effect on services employment

Graph 4. Relationship between Value-added of Services and Industry

. Table 8 present data of real Value-Added per capita in Dollars at 2000 prices and exchange rates, of industry and services in the seven OECD countries of table 7 in years 1994 and 2006.

Source: Elaborated by Guisan and Exposito from OECD National Accounts.

In table 9 we present the estimation of the relationship between real Value-Added per head in Services (QHS00) and Industry (QHI), and the relationship between the Employment Rate in Services (LHS) and QHS00. Estimations correspond to a panel sample of 7 countries of table 7 for the period 1994-2006. Value-added per head is measured in thousand Dollars per inhabitant at 2000 prices and exchange rates, and Employment Rate is the number of employed people per one thousand inhabitants.

Table 9. Estimated equations for real Value-added and employment rate of Services: Panel data

Explanatory variables	Dependent variable QHS00		Dependent variable LHS	
	Method LS	Method GLS	Explanatory variables	Method GLS
QHS00?(-1)	1.0215 (764) *	1.0218 (392)*	C + Country Dummy	196.3 (6.72)*
D(QHI00?)	0.3081 (1.79)**	0.3442 (2.55)*	QHS00?	7.95 (3.80)*
Adjusted R-squared	0.999364	0.999632	Adjusted R-squared	0.991533
S.E. of regression	0.1590	0.1222	S.E. of regression	6.2633
Durbin-Watson stat	0.7015	1.9672	Durbin-Watson stat	1.3996

Note: Panel of 7 countries for 1994-2006. LS=Least Squares and GLS=Generalized LS with AR(1) 0.64 in both equations. Terms between brackets: t student statistics. *, **, significant at 5% and 10% level.

The results show a high goodness of fit and the positive impact of industry on real Value-Added of Services, as well as the positive impact of real Value-Added on the Employment Rate of Services. The GLS estimations have into account the effects of other

Both regressions show a high level of goodness of fit and significant coefficients, being the GLS better because it has into account the effects of some missing explanatory variables through the AR(1) term. In Guisan(2006) and (2007) other effects are analysed

As reported in Guisan and Aguayo(2005) and other studies, industry and tourism are usually of great important to increase real value-added and employment in services in European regions, and thus they have great impact in female employment given the high percentage of employment of women in services.

Industry: With a total of 2773 thousand employments of this sector in Spain, the most outstanding regions were: Cataluña, Com. Valenciana, Madrid, Andalucía and País Vasco. The three most outstanding regions for each industrial sector were: 1) Energy: Madrid, Andalucía and Cataluña. 2) Intermediate goods: Cataluña. Com. Valenciana and Madrid. 3) Capital goods: Cataluña, País Vasco and Madrid. 4) Consumption goods: Cataluña, Com. Valenciana and Andalucía.

The 3 most outstanding regions for each sector of services were: 1) Services of transports and communications, Madrid, Cataluña and Andalucía. 2) Services of commerce, hotels, restaurants, business, financial, and other market services (including private health and private education), with a total of 8831 thousand employments: Madrid, Cataluña and Andalucía. 3) Public services (administration, health, education and social services) and other non market services, with a total of 3561 thousand employments: Andalucía, Madrid and Cataluña.

Tabla A5: Distribution by economic branches of male and female employment in Spain, Germany and 25 European Union countries (EU25).

Sector	% of male employment			% of female employment		
	EU25	Germany	Spain	EU25	Germany	Spain
